Authors' contributions

This work was carried out in collaboration between all authors. Author MS designed the study, wrote the protocol and wrote the first draft of the manuscript. Author AAM managed the literature searches, analyses of the study and performed the spectroscopy analysis. Author IDB managed the experimental process. Author SM was the supervisor and he contributed a lot to the work mostly identification of the species and corrections of the botanical names. All authors read and approved the final manuscript.

Original Research Article

ABSTRACT

Floristic data, life form, and chorotype identification play an important role in planning, management and conservation of vegetation regimes. This study attempted to determine the systematic composition, life forms, and chorology of Aguié department in Niger. We used a systematic sampling approach to inventory vegetation within the agroforestry systems of the Aguié department in August and September 2013. The size of the terrestrial plots was 50 mx 50 m while the aquatic plots were 4 mx 4 m. We recorded 272 plant species belonging to 52 families and 161 genera. The family Poaceae is represented the highest number of species (45) followed by Fabaceae (30), Mimosaceae (16), Caesalpiniaceae (15), Euphorbiaceae (11), and Cyperaceae (10). The Shannon Weaver Diversity Index (H') calculated based on 51 plots was 2.55 bits. Therophytes (142) species

*Corresponding author: E-mail: moussa_soulesama@yahoo.fr;

(54.41% of therophytes species) are the dominant life forms in the study area followed by Phanerophytes 83 species (31.25%), Chamephytes 15 species (5.88%), Hydrophytes 9 species (3.30%), and Geophytes 7 species (2.5%). Hemicryptophytes and Lianas account for 3 and 4 species respectively. Chorological analysis of the inventoried flora revealed that Sudano-Zambezians (SZ) are represented by 55.28% (136 species) followed by Congolese-Sudano-Zambezians (GC-SZ) 30.48% (75 species), Sudano-Zambezians -Saharo-Sindians (SZ-Sah.S) 7.31% (16 species) and 10 (4.32%) for introduced species which indicates the anthropogenic impact on the flora of Aguié department. The analysis of biological spectrum reveals that the phytoclimate is therophanerophytic. The domination of therophytes indicates that Aguié department is a dryland area while the dominance of phanerophytes expresses the management and conservation practices within the agrosystems of Aguié department. We recommend further research that examines at the impact of land use activities on the dynamics of agroforestry systems of Aguié department.

Keywords: Systematic composition; life form; chorology; Aguié department.

1. INTRODUCTION

Niger is one of the largest countries in West Africa covering an area of 1,267,000 km². The population is roughly 17.7 million people and growing at 3.9% per year [1]. Physically, the environment is characterized by a diverse microclimates resulting in high biodiversity within the broader Sahelian climate [2]. Agroforestry systems provide a lot of services to the rural people in Niger [3-6]. However overexploitation and climate variability constitute a great threat to Niger agroforestry systems dynamics [5].

Several botanical studies have been done in the respect of agroforestry systems in Niger [2,3,7]. A lot of studies have been carried out the agroforestry systems of Aguié [8,9,6], but there were few of them studied the combination of systematic composition, life forms and chorology of the agroforestry systems of Aguié Department.

Systematic composition refers to how many species, genera and botanical families contains a given ecosystems at a given period. While life form is an indicator used to describe world vegetation types and they are indicator of climatic conditions of a given area [10]. Further life form is a vital attribute of ecosystem. Life forms plays useful role in studying the vegetation [11]. Meanwhile chorology refers to geographical distribution of plants, it is also phytogeographical study [12]. Chorology is also a description of chorotypes found within a given area.

Botanical study about the flora, its life form and phytogeographical types are essential for providing information for sustainable parklands management of Aguié department. The study provides a comprehensive contribution to the

Flora of Aguié department. The objective of the study is determine systematic composition, life forms and phytogeographical types of the parklands of Aguié department.

2. MATERIALS AND METHODS

2.1 Study Area

Aguié is a department found of Maradi region of Niger republic. Aguié lies between 13°51'21"N and 08°18'12"E (Fig. 1). Population of Aguié department was estimated at 386.197 [1]. Agriculture is the principal activity of the people of Aguié. But *Cyperus esculentus* is the cash crop characteristic of the department. Besides agricultural activity, the people of Aguié engage in livestock production. Parklands provide many services to the people of Aguié such as firewood, raw materials, animal fodder etc. They provide to them the food such as the leaves and fruits.

The climate of Aguié is south sahelian type with following characteristics [2]: Rainfall index = 400 mm < RI < 600 mm; relative humidity = 18% (March) < RH < 70.5 % (August); Temperature = 19°C (January) < T° < 32°8C (May).

Aguié has various soil types including sandy soil and ferruginous tropical soils. The vegetation of Aguié belongs to south sahelian central (B2) compartment for the phytogeographical subdivision [2]. Dan Kada Dodo forest reserve, Dan Gado forest reserve and, Bakabé forest reserve are the types of the vegetation of Aguié department. But the parklands such as croplands, fallow lands and pasturelands is the dominant vegetation types within the department. The study sites were Dodo, Bamo, Dan kéri, Gamji Saboua, Guidan Tanko, Guidan

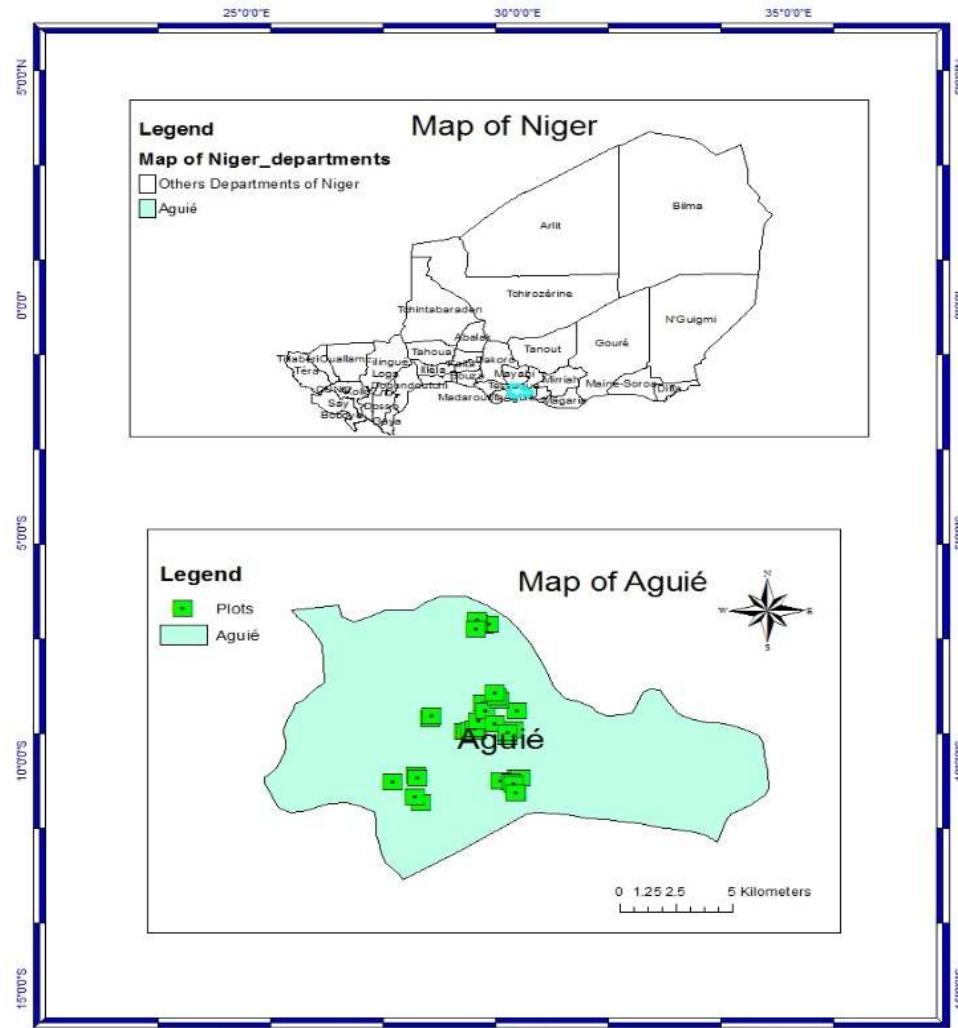

Fig. 1. Map of study area Aguié department showing sample plots

Nahantchi, Saja Manja, Bakabé, Mai Sanho, Dan Saga, Aguié commune, and Dan Kada, they were randomly selected.

2.2 Data Collection and Data Analysis

The inventory of plant species of Aguié department was carried out in August and September which corresponds to the period of optimum for sahelian vegetation [2]. A systematic sampling was used in order to capture the environmental heterogeneity [8]. The size of the plots was 50mx50m (2500 m²) which is minimal area the agroforestry systems and 16 (4 m x 4 m) for aquatic prairie adopted by [13]. Pole and meter were used to delimit the plots size. Data was collected from 51 plots but 7 plots were aquatic. The plots were showed in Fig. 1. Within

each plot all the species were recorded, GPS coordinates of each plot was taken. The flora of Hutchinson and Michel Arbonnier book [14] were used to identify the species. The botanical classification used was the Cronquist system. Herbarium was also used to identify some species at Department of Biology, University Dan Dicko Dan Koulodo of Maradi, Niger. Furthermore the pictures of some plants, fruits and leaves were taken with camera for species determination. In this study to determine the life form Raunkaier's method, in [2], applied by [15] and [16] was used. The method classifies the life form into five types:

- 1. Phanerophytes (Ph):** Woody plant that the renewal bud above 50 cm from soil surface. The subdivision such as

Nanophanerophytes (NnPh 0.5 to 2 m); Microphanerophytes (McPh 2 to 8 m); Mesophanerophytes (MsPh, 8 to 30 m) and Megaphanerophytes (MPh, more than 30 m) constitutes the phanerophytes (Ph).

2. **Champhytes (Ch):** Woody plant or suffrutescent perennial that the renewal bud situated at 50cm above of the soil.
3. **Hemicryptophytes (H):** Perennial plant that the renewal bud is at the soil surface.
4. **Geophytes (G):** Plant that the renewal bud is buried within the soil.
5. **Therophytes (Th):** Annual plants that form their spores or seeds within only one period of life. Therophytes Liana (L). Among the five life form types, they can be hydrophytes (Hy) which are the plants that the renewal bud is situated at the bottom of the water.

To identify the chorological types of Aguié agroforestry systems the study used are those defined by [17] and [2] at African scale. They chorotypes used are: Guineo-Congolese-Sudano-Zambezians (GC-SZ); Sudano-Zambezians (SZ); Sudano-Zambezians –Saharo-Sindians (SZ-Sah. S); Saharo-Sindians (Sah. S); Saharo-Sindians- Mediterranean (Sah.S-Med); Sudano- Zambezians- Saharo- Sindians- Mediterranean (SZ-Sah.S.med), Sudanian: S and Introduced Species: I.

The Shannon diversity index (H') was used to characterize species diversity in agroforestry systems of Aguié Department using this formula:

$$H' = - \sum_{i=1}^S p_i (\log_2 p_i)$$

S = total number of species p_i = (n_i / N) relative frequency of species ($\sum p_i = 1$). n_i = relative frequency of species i in the sampling unit N = sum of the specific relative frequencies.

The relative frequency of each botanical families, species' life form and chorotypes were calculated using the number of species using Excel.

3. RESULTS AND DISCUSSION

3.1 Systematic Composition of Aguié Agroforestry Systems

The results of this study show that 272 plant species belonging to 53 families and 161 genera

were recorded in agroforestry systems of Aguié Department. The family Poaceae is represented by the highest number of species (45 species) followed by Fabaceae (30 species), Mimosaceae (17), Caesalpiniaceae (15 species), Euphorbiaceae (11 species) and Cyperaceae (10 species). Forty six families were represented by 139 species (Table 1). The Shannon Diversity Index (H') calculated based 51 plots was low with 2.55 bits. But it was greater than the results found by [18,7] in Maradi region. Further, [19] found Shannon Diversity Index (H') of 2.8 bits in Maradi region which was considered greater 1.9 bits found in Diffa region in Niger. Our result was greater than 1.9 bits found in Diffa by [19]. Our result is also greater than 2.34 bits found by [20] in Aguié department. Our result explained due to the fact that Aguié department we collected the floristic data from the three forest reserves, sudanian zone of Aguié, aquatic plots from the wetlands and the implementation in zone of farmer managed tree natural regeneration and woody species tenure in parklands management. The dominance of Poaceae means that the flora is composed of annuals. This is explained due to the area is semi-arid. The dominance of Poaceae (42 species) and Fabaceae (28 species) in the agroforestry systems of Aguié agree with the results found in Niger by some authors of [15,21,16]. Furthermore, the dominance of Poaceae and Fabaceae coincides with the results found by [22] in Saudi Arabia. The current result in this regard also agrees with the result found by [23] which considered that Poaceae and Fabaceae as the most dominant botanical families at Khulais region in Saudi Arabia.

3.2 Life Forms of Aguié Agroforestry Systems

The analysis of life forms of Aguié department shows that therophytes 148 species (54.41%) are the dominant life forms in the study area followed by Phanerophytes 85 species (31.25%), Champhytes 16 species (5.88%), Hydrophytes 9 species (3.30%), and Geophytes 7 species (2.5%). Hemicryptophytes and Lianas account for 3 and 4 species, representing 1.47% and 1.10 % respectively. The dominance of therophytes means the flora is annual which develops the strategy to avoid water shortage. The dominance of phanerophytes within Aguié flora indicates the management practices such as the farmer managed tree natural regeneration and conservation methods such as woody species ownership used by agroforestry systems farmers to conserve the woody species within their

croplands. Further, the dominance of species for agroforestry purposes. The phanerophytes within the inventoried flora phytoclimate of Aguié department is explains that the farmers conserve woody therophanerophytic. Our result, the dominance of

Table 2. Chorotypes and their relative percentage in flora of agroforestry systems of Aguié

Chorotypes	SZ	GC-SZ	SZ-Sah.S	SZ-Sah-Med	Sah-S	i	S	Total
Number	136	75	18	4	1	10	2	246
Percentage (%)	55.28	30.48	7.31	1.62	0.40	4.06	0.81	100

therophytes confirms what some authors found in Niger ecosystems [15,21,16] who found respectively that the therophyte was dominant life form in their study zones. Further, the current results are similar to some authors [24,11,25] who found also respectively that the therophyte was dominant life form in their study areas.

3.3 Chorology of Agroforestry Systems of Aguié Department

Chorological analysis at Africa scale of the inventoried flora of Aguié Department shows that Sudano-Zambezians (SZ) are represented by 55.28% (136 species) followed by Congolese-Sudano-Zambezians (GC-SZ) 30.48% (75 species), Sudano-Zambezians –Saharo-Sindians (SZ-Sah.S)) 7.31% (18 species). 10(4.06%) introduced species were also recorded. Our result, the dominance of Sudano-Zambezians (SZ) in parklands of Aguié is similar to the results of [26] who revealed the dominance of Sudano-Zambezians (SZ) in all Western part of Niger. The only difference is that our result reveals the dominance of SZ in the parklands in south-central Niger. But [20] found the same result which revealed that (59.5%) was represented by Sudano-Zambezians (SZ) in Dan kada Dodo-Dan Gado forest reserve in Aguié department.

4. CONCLUSION

The Agroforestry systems of Aguié department is rich in phytobiodiversity. The systematic composition of Aguié department is diverse in terms of species, genera and botanical families. In the present study, the high percentage of therophytes indicate that Aguié department is semi-arid while the dominance of phanerophytes is an indicator of sustainable woody species management in the parklands. The phytoclimate of Aguié is therophanerophytic. The study recommends further study that will look at the impact of human activities on the agroforestry systems dynamics in Aguié department.

ACKNOWLEDGEMENTS

Authors are grateful to the rural populations of Aguié Department who gave us the accommodation during our stay in their different villages. Our sincere acknowledgment goes to

the University Dan Dicko Dankoulodo of Maradi, Niger mainly to the Professors Saadou Mahamane and Ali Mahamane who provided the financial resources and botanical assistance to carry out the study.

COMPETING INTERESTS

Authors have declared that no competing interests exist.
